

We are using wasted raspberry biomass instead of wood and non-renewal sources of energy to make fuel or grill briquettes.

Description

RioRE briquette Our aim is to produce fuel briquettes from raspberry biological waste. Our briquettes are cheaper, and they burn longer than wood. It is a 100% environmentally friendly natural product. Briquettes are formed in cylindrical logs using high mechanical pressure without the use of chemical or binder. The product is a replacement for conventional fossil fuels and can be used across various manufacturing facilities such as boilers, furnaces and kilns. We don't use wood, yet we have enough raw materials which amount increases every year. We

Serbia

Business Model

Main problem for our future customers is - season`s average household heating costs. We want to help them to save money with our product, and also to teach local farmers to use wasted raspberry biomass instead of wood and non-renewal sources of energy, by giving them the opportunity to earn from their waste. With production of briquette we would enable the producers of biowaste to safely dispose off the waste from their patches, and in return receive firewood briquettes.

Category

Clean Energy; Waste to energy

Target

We want to enlarge our producing capacities to be capable of producing enough briquettes for our beachhead market.
